

Package ‘statsExpressions’

February 19, 2021

Type Package

Title Expressions and Dataframes with Statistical Details

Version 0.7.1

Maintainer Indrajeet Patil <patilindrajeet.science@gmail.com>

Description Statistical processing backend for 'ggstatsplot', this package creates expressions with details from statistical tests. It can additionally return dataframes with these results, which also make these functions a more pipe-friendly way to do statistical analysis. Currently, it supports only the most common types of statistical approaches and tests: parametric, nonparametric, robust, and Bayesian versions of t-test/ANOVA, correlation analyses, contingency table analysis, and meta-analysis.

bf_extractor	<i>Extract Bayes Factors from BayesFactor model object.</i>
--------------	---

Description

Extract Bayes Factors from BayesFactor model object.

Usage

```
bf_extractor(
  bf.object,
  conf.level = 0.95,
  k = 2L,
  top.text = NULL,
  output = "dataframe",
  ...
)
```

Arguments

<code>bf.object</code>	An object from BayesFactor package.
<code>conf.level</code>	Confidence/Credible Interval (CI) level. Default to 0.95 (95%).
<code>k</code>	Number of digits after decimal point (should be an integer) (Default: <code>k = 2L</code>).
<code>top.text</code>	Text to display on top of the Bayes Factor message. This is mostly relevant in the context of <code>ggstatsplot</code> functions.
<code>output</code>	If "expression", will return expression with statistical details, while "dataframe" will return a dataframe containing the results.
<code>...</code>	Additional arguments passed to <code>parameters::model_parameters.BFBayesFactor()</code> .

Note

Important: don't enter `1/bf.object` to extract results for null hypothesis; doing so will return wrong results.

Examples

```
# setup
library(statsExpressions)
set.seed(123)

# creating a `BayesFactor` object
bf_obj <-
  BayesFactor::anovaBF(
    formula = Sepal.Length ~ Species,
    data = iris,
    progress = FALSE
  )

# extracting Bayes Factors in a dataframe
bf_extractor(bf_obj)
```

bugs_long

Tidy version of the "Bugs" dataset.

Description

Tidy version of the "Bugs" dataset.

Usage

```
bugs_long
```

Format

A data frame with 372 rows and 6 variables

- subject. Dummy identity number for each participant.
- gender. Participant's gender (Female, Male).
- region. Region of the world the participant was from.
- education. Level of education.
- condition. Condition of the experiment the participant gave rating for (**LDLF**: low frighteningness and low disgustingness; **LFHD**: low frighteningness and high disgustingness; **HFHD**: high frighteningness and low disgustingness; **HFHD**: high frighteningness and high disgustingness).
- desire. The desire to kill an arthropod was indicated on a scale from 0 to 10.

Details

This data set, "Bugs", provides the extent to which men and women want to kill arthropods that vary in frighteningness (low, high) and disgustingness (low, high). Each participant rates their attitudes towards all anthropods. Subset of the data reported by Ryan et al. (2013).

Examples

```
dim(bugs_long)
head(bugs_long)
dplyr::glimpse(bugs_long)
```

expr_contingency_tab *Expression and dataframe for contingency table analysis*

Description

Maturing

A dataframe containing results from for contingency table analysis or goodness of fit test.

For more details, see- https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html

Usage

```
expr_contingency_tab(
  data,
  x,
  y = NULL,
  paired = FALSE,
  type = "parametric",
  counts = NULL,
  ratio = NULL,
```

```

    k = 2L,
    conf.level = 0.95,
    sampling.plan = "indepMulti",
    fixed.margin = "rows",
    prior.concentration = 1,
    top.text = NULL,
    output = "expression",
    ...
  )

```

Arguments

data	A dataframe (or a tibble) from which variables specified are to be taken. A matrix or tables will not be accepted.
x	The variable to use as the rows in the contingency table.
y	The variable to use as the columns in the contingency table. Default is NULL. If NULL, one-sample proportion test (a goodness of fit test) will be run for the x variable. Otherwise association test will be carried out.
paired	Logical indicating whether data came from a within-subjects or repeated measures design study (Default: FALSE). If TRUE, McNemar's test expression will be returned. If FALSE, Pearson's chi-square test will be returned.
type	A character specifying the type of statistical approach. Four possible options: <ul style="list-style-type: none"> "parametric" "nonparametric" "robust" "bayes" Corresponding abbreviations are also accepted: "p" (for parametric), "np" (for nonparametric), "r" (for robust), or "bf" (for Bayesian).
counts	A string naming a variable in data containing counts, or NULL if each row represents a single observation.
ratio	A vector of proportions: the expected proportions for the proportion test (should sum to 1). Default is NULL, which means the null is equal theoretical proportions across the levels of the nominal variable. This means if there are two levels this will be <code>ratio = c(0.5, 0.5)</code> or if there are four levels this will be <code>ratio = c(0.25, 0.25, 0.25, 0.25)</code> , etc.
k	Number of digits after decimal point (should be an integer) (Default: <code>k = 2L</code>).
conf.level	Confidence/Credible Interval (CI) level. Default to 0.95 (95%).
sampling.plan	Character describing the sampling plan. Possible options are "indepMulti" (independent multinomial; default), "poisson", "jointMulti" (joint multinomial), "hypergeom" (hypergeometric). For more, see <code>?BayesFactor::contingencyTableBF()</code> .
fixed.margin	For the independent multinomial sampling plan, which margin is fixed ("rows" or "cols"). Defaults to "rows".
prior.concentration	Specifies the prior concentration parameter, set to 1 by default. It indexes the expected deviation from the null hypothesis under the alternative, and corresponds to Gunel and Dickey's (1974) "a" parameter.
top.text	Text to display on top of the Bayes Factor message. This is mostly relevant in the context of <code>ggstatsplot</code> functions.

output If "expression", will return expression with statistical details, while "dataframe" will return a dataframe containing the results.

... Additional arguments (currently ignored).

Examples

```
# for reproducibility
set.seed(123)
library(statsExpressions)

# ----- non-Bayesian -----

# association test
expr_contingency_tab(
  data = mtcars,
  x = am,
  y = cyl,
  paired = FALSE,
  output = "dataframe"
)

# goodness-of-fit test
expr_contingency_tab(
  data = as.data.frame(HairEyeColor),
  x = Eye,
  counts = Freq,
  ratio = c(0.2, 0.2, 0.3, 0.3)
)

# ----- Bayesian -----

# association test
expr_contingency_tab(
  data = mtcars,
  x = am,
  y = cyl,
  paired = FALSE,
  type = "bayes",
  output = "dataframe"
)

# goodness-of-fit test
expr_contingency_tab(
  data = as.data.frame(HairEyeColor),
  x = Eye,
  counts = Freq,
  ratio = c(0.2, 0.2, 0.3, 0.3),
  type = "bayes"
)
```

Description

Maturing

A dataframe containing results from correlation test with confidence intervals for the correlation coefficient estimate. Results are extracted via `correlation::correlation`.

Usage

```
expr_corr_test(
  data,
  x,
  y,
  type = "parametric",
  k = 2L,
  conf.level = 0.95,
  tr = 0.2,
  bf.prior = 0.707,
  top.text = NULL,
  output = "expression",
  ...
)
```

Arguments

data	A dataframe (or a tibble) from which variables specified are to be taken. A matrix or tables will not be accepted.
x	The column in data containing the explanatory variable to be plotted on the x-axis. Can be entered either as a character string (e.g., "x") or as a bare expression (e.g, x).
y	The column in data containing the response (outcome) variable to be plotted on the y-axis. Can be entered either as a character string (e.g., "y") or as a bare expression (e.g, y).
type	<p>A character specifying the type of statistical approach. Four possible options:</p> <ul style="list-style-type: none"> • "parametric" • "nonparametric" • "robust" • "bayes" <p>Corresponding abbreviations are also accepted: "p" (for parametric), "np" (for nonparametric), "r" (for robust), or "bf" (for Bayesian).</p>
k	Number of digits after decimal point (should be an integer) (Default: k = 2L).
conf.level	Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).
tr	Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.
bf.prior	A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates.
top.text	Text to display on top of the Bayes Factor message. This is mostly relevant in the context of ggstatsplot functions.

output	If "expression", will return expression with statistical details, while "dataframe" will return a dataframe containing the results.
...	Additional arguments (currently ignored).

References

For more details, see- https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html

Examples

```
# for reproducibility
set.seed(123)
library(statsExpressions)

# without changing defaults
expr_corr_test(
  data = ggplot2::midwest,
  x = area,
  y = percblack
)

# changing defaults
expr_corr_test(
  data = ggplot2::midwest,
  x = area,
  y = percblack,
  type = "robust",
  output = "dataframe"
)
```

expr_meta_random

Expression and dataframe for random-effects meta-analysis

Description

Maturing

A dataframe containing results from random-effects meta-analysis.

For more details, see- https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html

Usage

```
expr_meta_random(
  data,
  type = "parametric",
  random = "mixture",
  k = 2L,
  conf.level = 0.95,
  top.text = NULL,
  output = "expression",
  ...
)
```

Arguments

data	A dataframe. It must contain columns named <code>estimate</code> (effect sizes or outcomes) and <code>std.error</code> (corresponding standard errors). These two columns will be used for <code>yi</code> and <code>sei</code> arguments in <code>metafor::rma</code> (for parametric analysis) or <code>metaplus::metapplus</code> (for robust analysis), and for <code>y</code> and <code>SE</code> arguments in <code>metaBMA::meta_random</code> (for Bayesian analysis).
type	A character specifying the type of statistical approach. Four possible options: <ul style="list-style-type: none"> • "parametric" • "nonparametric" • "robust" • "bayes" Corresponding abbreviations are also accepted: "p" (for parametric), "np" (for nonparametric), "r" (for robust), or "bf" (for Bayesian).
random	The type of random effects distribution. One of "normal", "t-dist", "mixture", for standard normal, <i>t</i> -distribution or mixture of normals respectively.
k	Number of digits after decimal point (should be an integer) (Default: <code>k = 2L</code>).
conf.level	Confidence/Credible Interval (CI) level. Default to 0.95 (95%).
top.text	Text to display on top of the Bayes Factor message. This is mostly relevant in the context of <code>ggstatsplot</code> functions.
output	If "expression", will return expression with statistical details, while "dataframe" will return a dataframe containing the results.
...	Additional arguments passed to the respective meta-analysis function.

Note

Important: The function assumes that you have already downloaded the needed package (`metafor`, `metapplus`, or `metaBMA`) for meta-analysis.

Examples

```
# run examples only if the needed packages are available
if (all(unlist(lapply(
  c("metapplus", "metafor", "metaBMA"), # needed packages
  require,
  character.only = TRUE,
  quietly = TRUE,
  warn.conflicts = FALSE
)))) {
  # note that the `print` calls below are not necessary for you to write
  # they are in the documentation so that the website renders them

  # setup
  set.seed(123)
  library(statsExpressions)

  # renaming to what `statsExpressions` expects
  df <- dplyr::rename(mag, estimate = yi, std.error = sei)

  # ----- parametric -----
```

```

# creating expression
print(expr_meta_random(data = df, output = "dataframe"))

# ----- random -----

# creating expression
print(expr_meta_random(
  data = df,
  type = "random",
  random = "normal",
  output = "dataframe"
))

# ----- Bayes Factor -----

# making expression
expr_meta_random(
  data = df,
  type = "bayes",
  output = "dataframe",
  # additional arguments given to `metaBMA`
  iter = 5000,
  summarize = "integrate",
  control = list(adapt_delta = 0.99, max_treedepth = 15)
)
}

```

expr_oneway_anova

Expression and dataframe for one-way ANOVA

Description

Maturing

A dataframe containing results for one-way ANOVA.

For more details, see- https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html

Usage

```

expr_oneway_anova(
  data,
  x,
  y,
  subject.id = NULL,
  type = "parametric",
  paired = FALSE,
  k = 2L,
  conf.level = 0.95,
  effsize.type = "omega",
  var.equal = FALSE,
  bf.prior = 0.707,
  tr = 0.2,

```

```

  nboot = 100,
  top.text = NULL,
  output = "expression",
  ...
)

```

Arguments

data	A dataframe (or a tibble) from which variables specified are to be taken. A matrix or tables will not be accepted.
x	The grouping variable from the dataframe data.
y	The response (a.k.a. outcome or dependent) variable from the dataframe data.
subject.id	In case of repeated measures design (<code>paired = TRUE</code> , i.e.), this argument specifies the subject or repeated measures id. Note that if this argument is <code>NULL</code> (which is the default), the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted and you leave this argument unspecified, the results can be inaccurate.
type	A character specifying the type of statistical approach. Four possible options: <ul style="list-style-type: none"> • "parametric" • "nonparametric" • "robust" • "bayes" Corresponding abbreviations are also accepted: "p" (for parametric), "np" (for nonparametric), "r" (for robust), or "bf" (for Bayesian).
paired	Logical that decides whether the experimental design is repeated measures/within-subjects or between-subjects. The default is <code>FALSE</code> .
k	Number of digits after decimal point (should be an integer) (Default: <code>k = 2L</code>).
conf.level	Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).
effsize.type	Type of effect size needed for <i>parametric</i> tests. The argument can be "eta" (partial eta-squared) or "omega" (partial omega-squared).
var.equal	a logical variable indicating whether to treat the two variances as being equal. If <code>TRUE</code> then the pooled variance is used to estimate the variance otherwise the Welch (or Satterthwaite) approximation to the degrees of freedom is used.
bf.prior	A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates.
tr	Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of <code>tr</code> , which is by default set to 0.2. Lowering the value might help.
nboot	Number of bootstrap samples for computing confidence interval for the effect size (Default: 100).
top.text	Text to display on top of the Bayes Factor message. This is mostly relevant in the context of <code>ggstatsplot</code> functions.
output	If "expression", will return expression with statistical details, while "dataframe" will return a dataframe containing the results.
...	Additional arguments (currently ignored).

Note

1. Please note that the function expects that the data is already sorted by subject/repeated measures ID.
2. To carry out Bayesian analysis for ANOVA designs, you will need to install the development version of BayesFactor (0.9.12-4.3). You can download it by running: `remotes::install_github("richarddmoores/BayesFactor")`.

Examples

```
# for reproducibility
set.seed(123)
library(statsExpressions)

# ----- parametric -----

# between-subjects
expr_oneway_anova(
  data = ggplot2::msleep,
  x = vore,
  y = sleep_rem
)

# within-subjects design
expr_oneway_anova(
  data = iris_long,
  x = condition,
  y = value,
  subject.id = id,
  paired = TRUE,
  output = "dataframe"
)

# ----- non-parametric -----

# between-subjects
expr_oneway_anova(
  data = ggplot2::msleep,
  x = vore,
  y = sleep_rem,
  type = "np"
)

# within-subjects design
expr_oneway_anova(
  data = iris_long,
  x = condition,
  y = value,
  subject.id = id,
  paired = TRUE,
  type = "np",
  output = "dataframe"
)

# ----- robust -----

# between-subjects
```

```

expr_oneway_anova(
  data = ggplot2::msleep,
  x = vore,
  y = sleep_rem,
  type = "r"
)

# within-subjects design
expr_oneway_anova(
  data = iris_long,
  x = condition,
  y = value,
  subject.id = id,
  paired = TRUE,
  type = "r",
  output = "dataframe"
)

# ----- Bayesian -----

# between-subjects
expr_oneway_anova(
  data = ggplot2::msleep,
  x = vore,
  y = sleep_rem,
  type = "bayes"
)

# within-subjects design
# needs `BayesFactor 0.9.12-4.3` or above
if (utils::packageVersion("BayesFactor") >= package_version("0.9.12-4.3")) {
  expr_oneway_anova(
    data = iris_long,
    x = condition,
    y = value,
    subject.id = id,
    paired = TRUE,
    type = "bayes",
    output = "dataframe"
  )
}

```

expr_template

Template for expressions with statistical details

Description

Questioning

Creates an expression from a dataframe containing statistical details. Ideally, this dataframe would come from having run `tidy_model_parameters` function on your model object.

This function is currently **not** stable and should not be used outside of this package context.

Usage

```
expr_template(
  data,
  no.parameters = 0L,
  bayesian = FALSE,
  statistic.text = NULL,
  effsize.text = NULL,
  top.text = NULL,
  prior.distribution = NULL,
  prior.type = NULL,
  n = NULL,
  n.text = NULL,
  paired = FALSE,
  conf.method = "HDI",
  k = 2L,
  k.df = 0L,
  k.df.error = 0L,
  ...
)
```

Arguments

<code>data</code>	<p>A dataframe containing details from the statistical analysis and should contain some or all of the the following columns:</p> <ul style="list-style-type: none"> • <i>statistic</i>: the numeric value of a statistic. • <i>df.error</i>: the numeric value of a parameter being modeled (often degrees of freedom for the test); note that if <code>no.parameters = 0L</code> (e.g., for non-parametric tests), this column will be irrelevant. • <i>df</i> relevant only if the statistic in question has two degrees of freedom (e.g., anova). • <i>p.value</i> the two-sided <i>p</i>-value associated with the observed statistic. • <i>estimate</i>: estimated value of the effect size. • <i>conf.level</i>: width for the confidence intervals. • <i>conf.low</i>: lower bound for effect size estimate. • <i>conf.high</i>: upper bound for effect size estimate. • <i>bf10</i> Bayes Factor value (if <code>bayesian = TRUE</code>). • <i>method</i>: method describing the test carried out.
<code>no.parameters</code>	An integer that specifies that the number of parameters for the statistical test. Can be 0 for non-parametric tests, 1 for tests based on <i>t</i> -statistic or chi-squared statistic, 2 for tests based on <i>F</i> -statistic.
<code>bayesian</code>	Is this Bayesian analysis? Defaults to FALSE. The template is slightly different for Bayesian analysis.
<code>statistic.text</code>	A character that specifies the relevant test statistic. For example, for tests with <i>t</i> -statistic, <code>statistic.text = "t"</code> .
<code>effsize.text</code>	A character that specifies the relevant effect size.
<code>top.text</code>	Text to display on top of the Bayes Factor message. This is mostly relevant in the context of <code>ggstatsplot</code> functions.
<code>prior.distribution</code>	A character that specifies the prior type.

prior.type	The type of prior.
n	An integer specifying the sample size used for the test.
n.text	A character that specifies the design, which will determine what the n stands for. If NULL, defaults to <code>quote(italic("n")["pairs"])</code> if <code>paired = TRUE</code> , and to <code>quote(italic("n")["obs"])</code> if <code>paired = FALSE</code> .
paired	Logical that decides whether the experimental design is repeated measures/within-subjects or between-subjects. The default is FALSE.
conf.method	The type of index used for Credible Interval. Can be "hdi" (default), "eti", or "si" (see <code>si()</code> , <code>hdi()</code> , <code>eti()</code> functions from bayestestR package).
k	Number of digits after decimal point (should be an integer) (Default: k = 2L).
k.df, k.df.error	Number of decimal places to display for the parameters (default: 0).
...	Currently ignored.

Examples

```
set.seed(123)

# creating a dataframe with stats results
stats_df <-
  cbind.data.frame(
    statistic = 5.494,
    df = 29.234,
    p.value = 0.00001,
    estimate = -1.980,
    conf.level = 0.95,
    conf.low = -2.873,
    conf.high = -1.088
  )

# expression for *t*-statistic with Cohen's *d* as effect size
# note that the plotmath expressions need to be quoted
statsExpressions::expr_template(
  no.parameters = 1L,
  data = stats_df,
  statistic.text = quote(italic("t")),
  effsize.text = quote(italic("d")),
  n = 32L,
  k = 3L,
  k.df = 3L
)
```

expr_t_onesample

Expression and dataframe for one-sample t-test

Description

Maturing

A dataframe containing results from a one-sample test. The exact test and the effect size details contained will depend on the type argument.

For more details, see- https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html

Usage

```

expr_t_onesample(
  data,
  x,
  type = "parametric",
  test.value = 0,
  k = 2L,
  conf.level = 0.95,
  tr = 0.2,
  bf.prior = 0.707,
  effsize.type = "g",
  nboot = 100L,
  top.text = NULL,
  output = "expression",
  ...
)

```

Arguments

data	A dataframe (or a tibble) from which variables specified are to be taken. A matrix or tables will not be accepted.
x	A numeric variable from the dataframe data.
type	<p>A character specifying the type of statistical approach. Four possible options:</p> <ul style="list-style-type: none"> • "parametric" • "nonparametric" • "robust" • "bayes" <p>Corresponding abbreviations are also accepted: "p" (for parametric), "np" (for nonparametric), "r" (for robust), or "bf" (for Bayesian).</p>
test.value	A number specifying the value of the null hypothesis (Default: 0).
k	Number of digits after decimal point (should be an integer) (Default: k = 2L).
conf.level	Confidence/Credible Interval (CI) level. Default to 0.95 (95%).
tr	Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.
bf.prior	A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates.
effsize.type	Type of effect size needed for <i>parametric</i> tests. The argument can be "d" (for Cohen's <i>d</i>) or "g" (for Hedge's <i>g</i>).
nboot	Number of bootstrap samples for computing confidence interval for the effect size (Default: 100).
top.text	Text to display on top of the Bayes Factor message. This is mostly relevant in the context of ggstatsplot functions.
output	If "expression", will return expression with statistical details, while "dataframe" will return a dataframe containing the results.
...	Currently ignored.

Examples

```
# for reproducibility
set.seed(123)
library(statsExpressions)

# ----- parametric -----

expr_t_onesample(
  data = ggplot2::msleep,
  x = brainwt,
  test.value = 0.275,
  type = "parametric"
)

# ----- non-parametric -----

expr_t_onesample(
  data = ggplot2::msleep,
  x = brainwt,
  test.value = 0.275,
  type = "nonparametric"
)

# ----- robust -----

expr_t_onesample(
  data = ggplot2::msleep,
  x = brainwt,
  test.value = 0.275,
  type = "robust"
)

# ----- Bayesian -----

expr_t_onesample(
  data = ggplot2::msleep,
  x = brainwt,
  test.value = 0.275,
  type = "bayes",
  bf.prior = 0.8
)
```

 expr_t_twosample

Expression and dataframe for two-sample t-test

Description

Maturing

A dataframe containing details from results of a two-sample test and effect size plus confidence intervals.

For more details, see- https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html

Usage

```

expr_t_twosample(
  data,
  x,
  y,
  subject.id = NULL,
  type = "parametric",
  paired = FALSE,
  k = 2L,
  conf.level = 0.95,
  effsize.type = "g",
  var.equal = FALSE,
  bf.prior = 0.707,
  tr = 0.2,
  nboot = 100,
  top.text = NULL,
  output = "expression",
  ...
)

```

Arguments

data	A dataframe (or a tibble) from which variables specified are to be taken. A matrix or tables will not be accepted.
x	The grouping variable from the dataframe data.
y	The response (a.k.a. outcome or dependent) variable from the dataframe data.
subject.id	In case of repeated measures design (<code>paired = TRUE</code> , i.e.), this argument specifies the subject or repeated measures id. Note that if this argument is <code>NULL</code> (which is the default), the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted and you leave this argument unspecified, the results can be inaccurate.
type	<p>A character specifying the type of statistical approach. Four possible options:</p> <ul style="list-style-type: none"> • "parametric" • "nonparametric" • "robust" • "bayes" <p>Corresponding abbreviations are also accepted: "p" (for parametric), "np" (for nonparametric), "r" (for robust), or "bf" (for Bayesian).</p>
paired	Logical that decides whether the experimental design is repeated measures/within-subjects or between-subjects. The default is <code>FALSE</code> .
k	Number of digits after decimal point (should be an integer) (Default: <code>k = 2L</code>).
conf.level	Confidence/Credible Interval (CI) level. Default to 0.95 (95%).
effsize.type	Type of effect size needed for <i>parametric</i> tests. The argument can be "d" (for Cohen's <i>d</i>) or "g" (for Hedge's <i>g</i>).
var.equal	a logical variable indicating whether to treat the two variances as being equal. If <code>TRUE</code> then the pooled variance is used to estimate the variance otherwise the Welch (or Satterthwaite) approximation to the degrees of freedom is used.

bf.prior	A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates.
tr	Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.
nboot	Number of bootstrap samples for computing confidence interval for the effect size (Default: 100).
top.text	Text to display on top of the Bayes Factor message. This is mostly relevant in the context of ggstatsplot functions.
output	If "expression", will return expression with statistical details, while "dataframe" will return a dataframe containing the results.
...	Currently ignored.

Note

The `stats::wilcox.test` function does not follow the same convention as `stats::t.test`. The sign of the V test statistic will always be positive since it is **the sum of the positive signed ranks**. Therefore, V will vary in magnitude but not significance based solely on the order of the grouping variable. Consider manually reordering your factor levels if appropriate as shown in the second example below.

Examples

```
# for reproducibility
set.seed(123)
library(statsExpressions)

# ----- parametric -----

# between-subjects design
expr_t_twosample(
  data = sleep,
  x = group,
  y = extra,
  type = "p"
)

# within-subjects design
expr_t_twosample(
  data = VR_dilemma,
  x = modality,
  y = score,
  paired = TRUE,
  subject.id = id,
  type = "p",
  output = "dataframe"
)

# ----- non-parametric -----

# between-subjects design
expr_t_twosample(
  data = sleep,
```

```

    x = group,
    y = extra,
    type = "np"
)

# within-subjects design
expr_t_twosample(
  data = VR_dilemma,
  x = modality,
  y = score,
  paired = TRUE,
  subject.id = id,
  type = "np",
  output = "dataframe"
)

# ----- robust -----

# between-subjects design
expr_t_twosample(
  data = sleep,
  x = group,
  y = extra,
  type = "r"
)

# within-subjects design
expr_t_twosample(
  data = VR_dilemma,
  x = modality,
  y = score,
  paired = TRUE,
  subject.id = id,
  type = "r",
  output = "dataframe"
)

#' # ----- Bayesian -----

# between-subjects design
expr_t_twosample(
  data = sleep,
  x = group,
  y = extra,
  type = "bayes"
)

# within-subjects design
expr_t_twosample(
  data = VR_dilemma,
  x = modality,
  y = score,
  paired = TRUE,
  subject.id = id,
  type = "bayes",
  output = "dataframe"
)

```

iris_long*Edgar Anderson's Iris Data in long format.*

Description

Edgar Anderson's Iris Data in long format.

Usage

```
iris_long
```

Format

A data frame with 600 rows and 5 variables

- id. Dummy identity number for each flower (150 flowers in total).
- Species. The species are *Iris setosa*, *versicolor*, and *virginica*.
- condition. Factor giving a detailed description of the attribute (Four levels: "Petal.Length", "Petal.Width", "Sepal.Length", "Sepal.Width").
- attribute. What attribute is being measured ("Sepal" or "Petal").
- measure. What aspect of the attribute is being measured ("Length" or "Width").
- value. Value of the measurement.

Details

This famous (Fisher's or Anderson's) iris data set gives the measurements in centimeters of the variables sepal length and width and petal length and width, respectively, for 50 flowers from each of 3 species of iris. The species are *Iris setosa*, *versicolor*, and *virginica*.

This is a modified dataset from datasets package.

Examples

```
dim(iris_long)
head(iris_long)
dplyr::glimpse(iris_long)
```

`movies_long`*Movie information and user ratings from IMDB.com (long format).*

Description

Movie information and user ratings from IMDB.com (long format).

Usage

```
movies_long
```

Format

A data frame with 1,579 rows and 8 variables

- title. Title of the movie.
- year. Year of release.
- budget. Total budget (if known) in US dollars
- length. Length in minutes.
- rating. Average IMDB user rating.
- votes. Number of IMDB users who rated this movie.
- mpaa. MPAA rating.
- genre. Different genres of movies (action, animation, comedy, drama, documentary, romance, short).

Details

Modified dataset from `ggplot2movies` package.

The internet movie database, <https://imdb.com/>, is a website devoted to collecting movie data supplied by studios and fans. It claims to be the biggest movie database on the web and is run by amazon.

Movies were identical to those selected for inclusion in `movies_wide` but this dataset has been constructed such that every movie appears in one and only one genre category.

Source

<https://CRAN.R-project.org/package=ggplot2movies>

Examples

```
dim(movies_long)
head(movies_long)
dplyr::glimpse(movies_long)
```

movies_wide*Movie information and user ratings from IMDB.com (wide format).*

Description

Movie information and user ratings from IMDB.com (wide format).

Usage

```
movies_wide
```

Format

A data frame with 1,579 rows and 13 variables

- title. Title of the movie.
- year. Year of release.
- budget. Total budget in millions of US dollars
- length. Length in minutes.
- rating. Average IMDB user rating.
- votes. Number of IMDB users who rated this movie.
- mpaa. MPAA rating.
- action, animation, comedy, drama, documentary, romance, short. Binary variables representing if movie was classified as belonging to that genre.
- NumGenre. The number of different genres a film was classified in an integer between one and four

Details

Modified dataset from `ggplot2movies` package.

The internet movie database, <https://imdb.com/>, is a website devoted to collecting movie data supplied by studios and fans. It claims to be the biggest movie database on the web and is run by amazon.

Movies were selected for inclusion if they had a known length and had been rated by at least one imdb user. Small categories such as documentaries and NC-17 movies were removed.

Examples

```
dim(movies_wide)
head(movies_wide)
dplyr::glimpse(movies_wide)
```

`tidy_model_effectsize` *Convert effectsize package output to tidyverse conventions*

Description

Convert effectsize package output to tidyverse conventions

Usage

```
tidy_model_effectsize(data)
```

Arguments

`data` Dataframe returned by effectsize functions.

Examples

```
df <- effectsize::cohens_d(sleep$extra, sleep$group)
tidy_model_effectsize(df)
```

`tidy_model_parameters` *Convert parameters package output to tidyverse conventions*

Description

Convert parameters package output to tidyverse conventions

Usage

```
tidy_model_parameters(model, ...)
```

Arguments

`model` Statistical Model.

`...` Arguments passed to or from other methods. Non-documented arguments are `digits`, `p_digits` and `ci_digits` to set the number of digits for the output. See 'Examples' in [model_parameters.default](#).

Examples

```
model <- lm(mpg ~ wt + cyl, data = mtcars)
tidy_model_parameters(model)
```

VR_dilemma	<i>Virtual reality moral dilemmas.</i>
------------	--

Description

Virtual reality moral dilemmas.

Usage

VR_dilemma

Format

A data frame with 68 rows and 4 variables

- id. Dummy identity number for each participant.
- order. The order in which the participants completed the two sessions: "text_first" (0) or "text_second" (1).
- modality. Describes how the moral dilemmas were presented to the participants: either in text format ("text") or in Virtual Reality ("vr").
- score. Proportion of "utilitarian" decisions. In other words, of the 4 decisions, how many affirmative were responses. Range: 0 (all utilitarian) - 1 (none utilitarian).

Details

Dataset from a study where participants completed identical moral dilemmas in two different sessions held on separate days: in one session, they read text description of the scenario, while in another session they completed the same scenarios in Virtual Reality (videos: <https://www.youtube.com/watch?v=ebdU3HhhYs8>). The study investigated if there was a discrepancy between how people judged the same scenarios while reading them in text versus experiencing them in virtual reality.
